

Sympathetic Vibratory Physics

Cavitation (Implosion) Bibliography

Dale Pond

“My system, in every part and detail, both in the developing of this power and in every branch of its utilization, is based and founded on *sympathetic vibration*. In no other way would it be possible to awaken or develop this force, and equally impossible would it be to operate my engine upon any other principle.”

John Keely, 1888

Discrete Noise Spectrum Generated by an Acoustically Excited Jet

Chahine, G. L., Courbiere, P.

Noise and Erosion of Self-Resonating Cavitating Jets

Journal Fluids Engineering, Vol. 109, pp. 429 December 1987 Self-resonating jets have been developed which take advantage of the natural tendency of a jet to organize in large structures. Tests have shown that these jets are both highly erosive and a source of a discrete frequency high level noise. Simultaneous investigations of the noise and erosion of these jets have been conducted and have shown a definite trend toward correlation. For instance, time evolution of volume removal rates of an impacted surface and rms readings of a pressure transducer have been found to be correlated. Similarly, shifts in the relative importance of the various frequencies have followed the advancement of erosion. These results could be of great advantage in the determination of the evolution of a jet cutting operation in progress. In this paper jet noise and erosion correlation tests will be described and the results analyzed.

Chahine, G. L., Johnson, Virgil, E., Lindenmuth, W. T., Frederick, G. S.

The Use of Self-Resonating Cavitating Water Jets for Underwater Sound Generation

Tracor Hydronautics, Journal of Acoustical Society of America January, 1985 A self-excited cavitating jet assembly is examined for possible use as an underwater noise generator. The principles of the system are based on matching the natural frequency of a submerged jet with that of a resonant chamber through a feedback mechanism. The case of an organ pipe resonant feed tube is thoroughly investigated. In this case, feedback is obtained by shaping the nozzle in order to optimize its interaction with instabilities in the shear layer of the jet. The performance of the noise generator is evaluated and its characteristics analyzed, including the influence of the pressure drop across the nozzle, the cavitation number, and the organ pipe length. It is observed that the efficiency of STRATOJET's (self-resonating cavitating jets) is more than two orders of magnitude higher than that of a conventional cavitating jet. The knowledge developed in this study allows for selection of the amplitude and frequency of the emitted noise by proper dimensioning of the assembly and correct choice of the functioning conditions.

Prasil, Prof. Franz
Surge Tank Problems
Canadian Engineer, vol. xxvii 1914 This differential equation has been obtained independently by Dr. D. L. Webster of the Physics Dept. of Harvard Un., and Prof. Franz Prasil, but neither of them succeeded in integrating it in its general form. To effect its integration both made the assumption that the friction head is proportional to the first power of the velocity instead of to its square. Under this assumption, the differential equation reduces to that for a damped harmonic oscillation, the solution of which is well known. "Surge Tank Problems" is authorized translation by E. R. Weinmann and D. R. Cooper. Also reprint in pamphlet form of this series of articles.

The Use of Self-Resonating Cavitating Water Jets for Underwater Sound Generation
Tracor Hydronautics, Journal of Acoustical Society of America January, 1985
A self-excited cavitating jet assembly is examined for possible use as an underwater noise generator. The principles of the system are based on matching the natural frequency of a submerged jet with that of a resonant chamber through a feedback mechanism. The case of an organ pipe resonant feed tube is thoroughly investigated. In this case, feedback is obtained by shaping the nozzle in order to optimize its interaction with instabilities in the shear layer of the jet. The performance of the noise generator is evaluated and its characteristics analyzed, including the influence of the pressure drop across the nozzle, the cavitation number, and the organ pipe length. It is observed that the efficiency of STRATOJET's (self-resonating cavitating jets) is more than two orders of magnitude higher than that of a conventional cavitating jet. The knowledge developed in this study allows for selection of the amplitude and frequency of the emitted noise by proper dimensioning of the assembly and correct choice of the functioning conditions.
- 12** Chahine, G. L., Courbiere, P.
Noise and Erosion of Self-Resonating Cavitating Jets
Journal Fluids Engineering, Vol. 109, pp. 429 December
Self-resonating jets have been developed which take advantage of the natural tendency of a jet to organize in large structures. Tests have shown that these jets are both highly erosive and a source of a discrete frequency high level noise. Simultaneous investigations of the noise and erosion of these jets have been conducted and have shown a definite trend toward correlation. For instance, time evolution of volume removal rates of an impacted surface and rms readings of a pressure transducer have been found to be correlated. Similarly, shifts in the relative importance of the various frequencies have followed the advancement of erosion. These results could be of great advantage in the determination of the evolution of a jet cutting operation in progress. In this paper jet noise and erosion correlation tests will be described and the results analyzed.

Formula for ordinary water hammer.

CAVITATION BIBLIOGRAPHY

69 Webster, D. L.

Penstock and Surge Tank Problems

M. M. Warren's paper, Trans. Am. Soc. C. E., vol. lxxix. 1915

This differential equation has been obtained independently by Dr. D. L. Webster of the Physics Dept. of Harvard Un., and Prof. Franz Prasil, but neither of them succeeded in integrating it in its general form. To effect its integration both made the assumption that the friction head is proportional to the first power of the velocity instead of to its square. Under this assumption, the differential equation reduces to that for a damped harmonic oscillation, the solution of which is well known.

70 Prasil, Prof. Franz

Surge Tank Problems

Canadian Engineer, vol. xxvii 1914

This differential equation has been obtained independently by Dr. D. L. Webster of the Physics Dept. of Harvard Un., and Prof. Franz Prasil, but neither of them succeeded in integrating it in its general form. To effect its integration both made the assumption that the friction head is proportional to the first power of the velocity instead of to its square. Under this assumption, the differential equation reduces to that for a damped harmonic oscillation, the solution of which is well known. "Surge Tank Problems" is authorized translation by E. R. Weinmann and D. R. Cooper. Also reprint in pamphlet form of this series of articles.

71 Church, I. P.

Penstock and Surge Tank Problems, discussion.

Trans. Am. Soc. C. E., vol. lxxix, p. 272. 1915

Discussion of Warren's article "Penstock and Surge Tank Problems."

72 Johnson, R. D.

Differential Surge Tanks

A.S.M.E. Pamphlet No. 1204 1908

Differential surge tank invented by R. D. Johnson, Hydraulic Engineer of Ontario Power Co. See also Eng. Record, July, 18, 1914, p. 82. Has done basic work to derive formulas for water hammer; see ASME Proceedings on Water Hammer.
