

New Concept - XVII - Regarding the Quantum Theory

XVII REGARDING THE QUANTUM THEORY

This theory claims not only that energy is within matter, but that it exists in "bundles". Its very basis has no relation to Nature anywhere, nor to the workings of polarity - the great divider - nor to the electric wave.

(click to enlarge)

One part of the theory describes certain microscopic "resonators" embedded within particles of matter to make it vibrate. These are set in motion, according to a recent article in [Scientific American](#), by light entering through holes which must be of just the right size in every case to cause the vibrations to release these "bundles" of energy. Nothing could be more fantastic nor more of a travesty of Nature, for the only cause of vibration is polarity.

The only vibrations there are in Nature are those interchanges between the two opposites of polarity which extend from zero to a plus and minus zero. These are the destination points between which motion oscillates in sequences of reversals. The reversals are the pulse beats of Nature. [[Walter Russell, A New Concept of the Universe](#), page 57]
